

ACE Utilities and Report Writer

In designing the M3 System, Rover Data Systems set out to create a series of integrated applications that provided a best of breed capability, but which were easily customizable to customer business processes at minimal expense. The ACE Utilities are the foundation upon which the M3 product was developed and provide various tools and processes to control and make adjustments to the application. These include an Integrated Development Environment (IDE), Security, Process Control, and modification logging.

- Integrated Development Environment
- Security
- Process Control
- Report Writer

Integrated Development Environment (IDE)

Businesses today are faced with constantly changing requirements. The ability to adapt your processes and systems to these requirements in a timely and cost effective manner is critical to maintaining profitability and customer satisfaction. The M3 IDE provides the tools required to make these changes quickly and easily.

- Provides a drag and drop form designer
- Contains data dictionary definitions
- Defines user defined lookups
- Has a complete program editor
- Allows menu definition
- Maintains modification logging to make future upgrades easier

Security

Your business depends on the critical information in your database. Your business can not function without trusted information on Customers, Orders, Financial Information, Inventory, Production Planning, etc. To insure this information is safe and reliable, and not compromised, you need the ability to restrict access to the appropriate personnel that you designate.

- Security profiles by individual user
- Define user templates for easy security definition
- Ability to set view, add, change and delete rights
- Ability to limit individual file access
- Establish rules and parameters for password assignment
